Manage and protect apps

Start managing apps

After you [add Kubernetes compute to Astra Control](#), you can install apps on the cluster (outside of Astra Control), and then go to the Apps page in Astra Control to start managing the apps.

Install apps on your cluster

Now that you've added your compute to Astra Control, you can install apps on the cluster. Persistent volumes will be provisioned on the new storage classes by default. After the pods are online, you can manage the app with Astra Control.

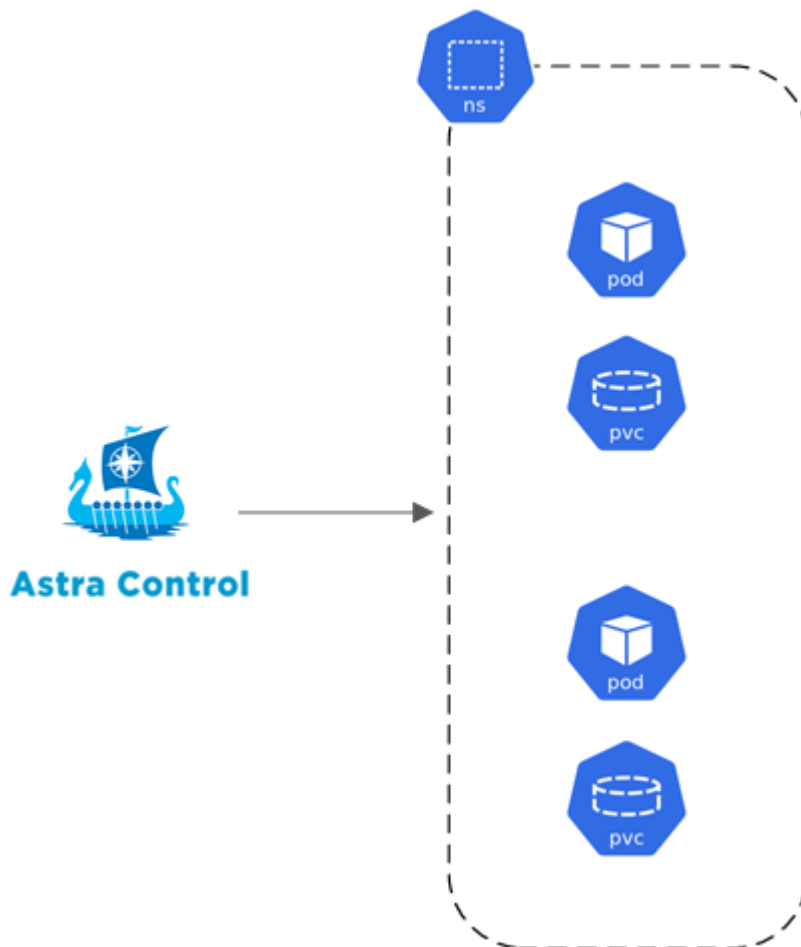

Astra Control will manage stateful apps only if the storage is on a storage class installed by Astra Control.

[Learn about storage classes for AKS clusters](#)

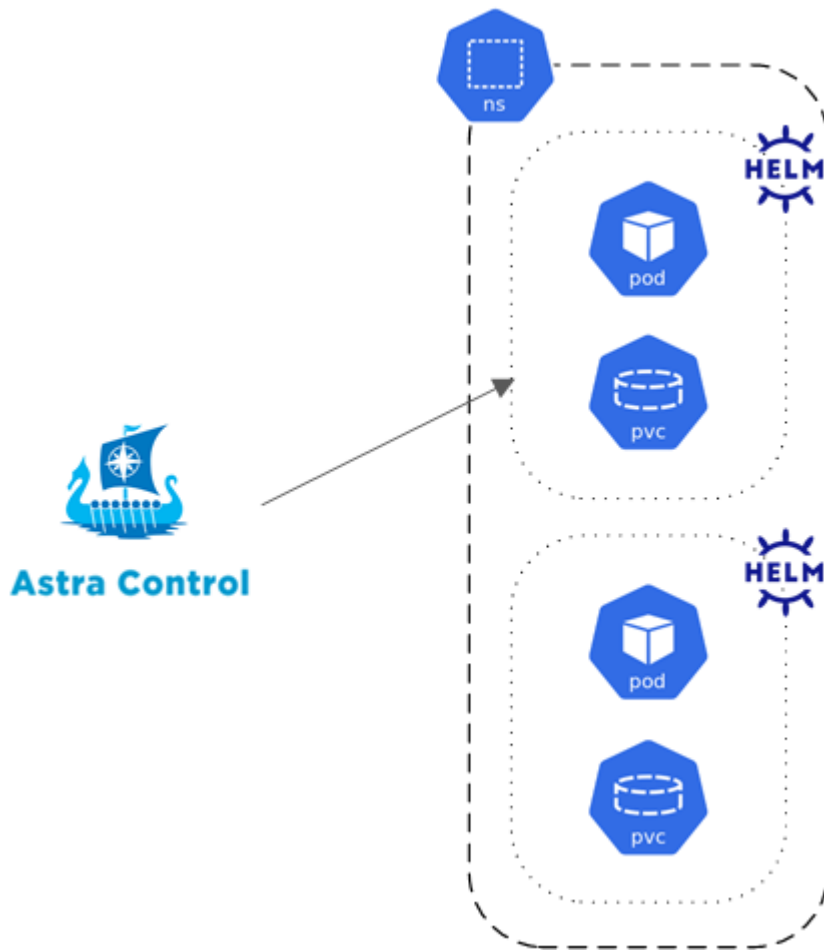

Manage apps

When Astra Control discovers the apps running on your clusters, they are unmanaged until you choose how you want to manage them. A managed application in Astra Control can be any of the following:

- A namespace, including all resources in that namespace

- An individual application deployed with helm3 within a namespace

- A group of resources that are identified by a Kubernetes label (this is called a *custom app* in Astra Control)

The sections below describe how to manage your apps using these options.

Manage apps by namespace

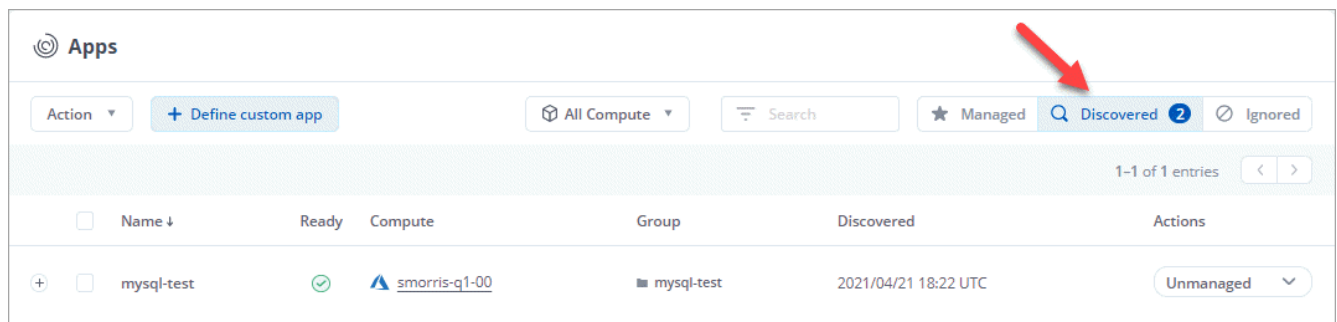

The **Discovered** section of the Apps page shows namespaces and the Helm-installed apps or custom-labeled apps in those namespaces. You can choose to manage each app individually or at the namespace level. It all comes down to the level of granularity that you need for data protection operations.

For example, you might want to set a backup policy for "maria" that has a weekly cadence, but you might need to back up "mariadb" (which is in the same namespace) more frequently than that. Based on those needs, you would need to manage the apps separately and not under a single namespace.

While Astra Control allows you to separately manage both levels of the hierarchy (the namespace and the apps in that namespace), the best practice is to choose one or the other. Actions that you take in Astra Control can fail if the actions take place at the same time at both the namespace and app level.

Steps

1. Click **Apps** and then click **Discovered**.

2. View the list of discovered namespaces and expand a namespace to view the apps and associated resources.

Astra Control shows you Helm apps and custom-labeled apps in namespace. If Helm labels are available, they're designated with a tag icon.

Here's an example with one app in a namespace:

3. Decide whether you want to manage each app individually or at the namespace level.
4. At the desired level in the hierarchy, click the drop-down list in the **Actions** column and click **Manage**.

5. If you don't want to manage an app, click the drop-down list in the **Actions** column for the desired app and click **Ignore**.

For example, if you wanted to manage all apps under the "mysql-test" namespace together so that they have the same snapshot and backup policies, you would manage the namespace and ignore the apps in the namespace:

Result

Apps that you chose to manage are now available from the **Managed** tab. Any ignored apps will move to the **Ignored** tab. Ideally, the Discovered tab will show zero apps, so that as new apps are installed, they are easier to find and manage.

Manage apps by Kubernetes label

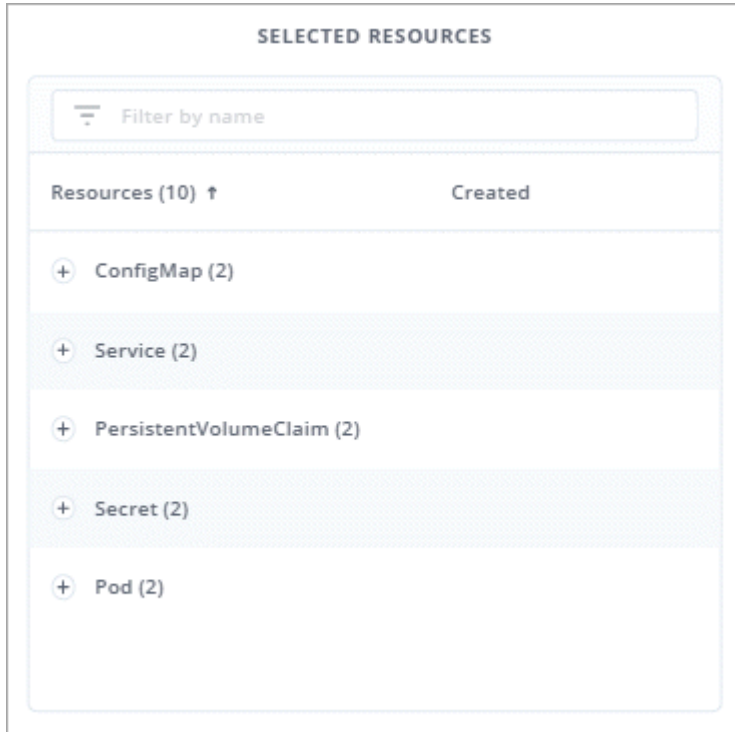

Astra Control includes an action at the top of the Apps page named **Define custom app**. You can use this action to manage apps that are identified with a Kubernetes label. [Learn more about defining apps by Kubernetes label](#).

Steps

1. Click **Apps > Define custom app**.
2. In the **Define Custom Application** dialog box, provide the required information to manage the app:
 - a. **New App**: Enter the display name of the app.
 - b. **Compute**: Select the compute where the app resides.

- c. **Namespace:** Select the namespace for the app.
- d. **Label:** Enter a label or select a label from the resources below.
- e. **Selected Resources:** View and manage the selected Kubernetes resources that you'd like to protect (pods, secrets, persistent volumes, and more).

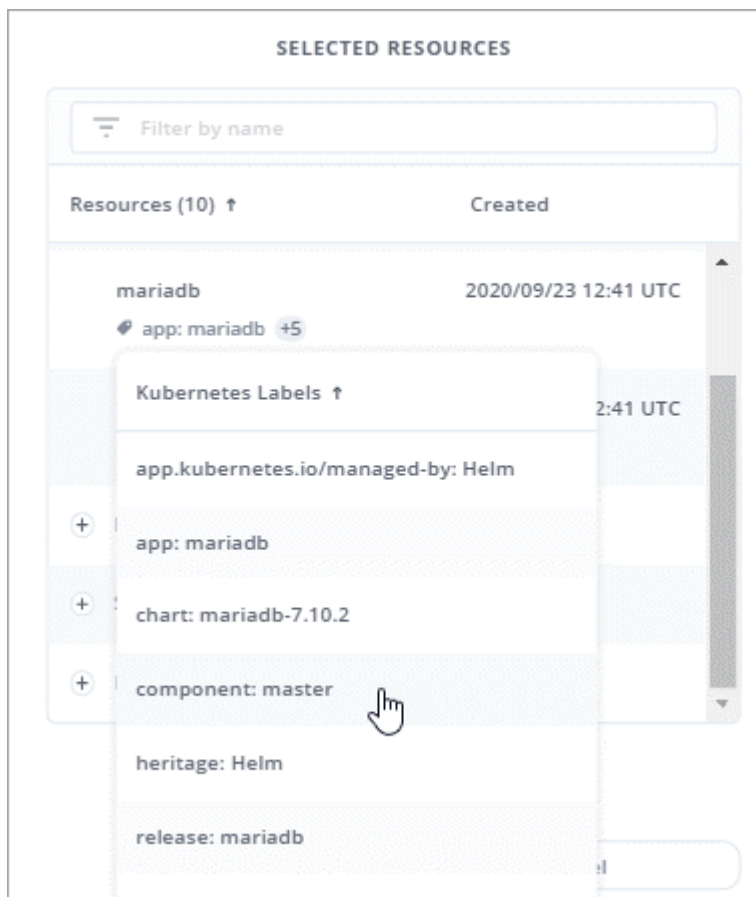

Here's an example:

- View the available labels by expanding a resource and clicking the number of labels.

- Select one of the labels.

After you choose a label, it displays in the **Label** field. Astra Control also updates the **Unselected Resources** section to show the resources that don't match the selected label.

- f. **Unselected Resources:** Verify the app resources that you don't want to protect.

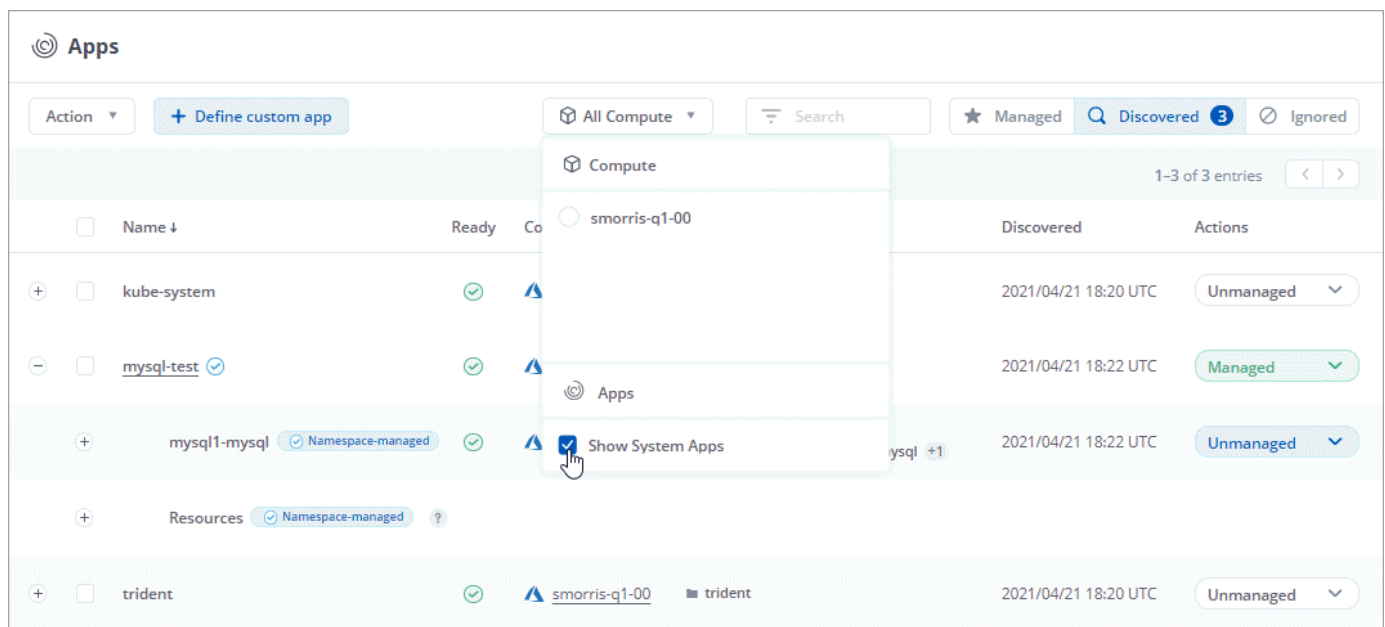

3. Click **Define Custom App**.

Result

Astra Control enables management of the app. You can now find it in the **Managed** tab.

What about system apps?

Astra Control also discovers the system apps running on a Kubernetes cluster. You can view them by filtering the Apps list.

We don't show you these system apps by default because it's rare that you'd need to back them up.

Protect apps with snapshots and backups

Protect your apps by taking snapshots and backups using an automated protection policy or on an ad-hoc basis.

Snapshots and backups

A *snapshot* is a point-in-time copy of an app that's stored on the same provisioned volume as the app. They are usually fast. Local snapshots are used to restore the application to an earlier point in time.

A *backup* is stored on object storage in the cloud. A backup can be slower to take compared to the local snapshots. But they can be accessed across regions in the cloud to enable app migrations. You can also choose a longer retention period for backups.

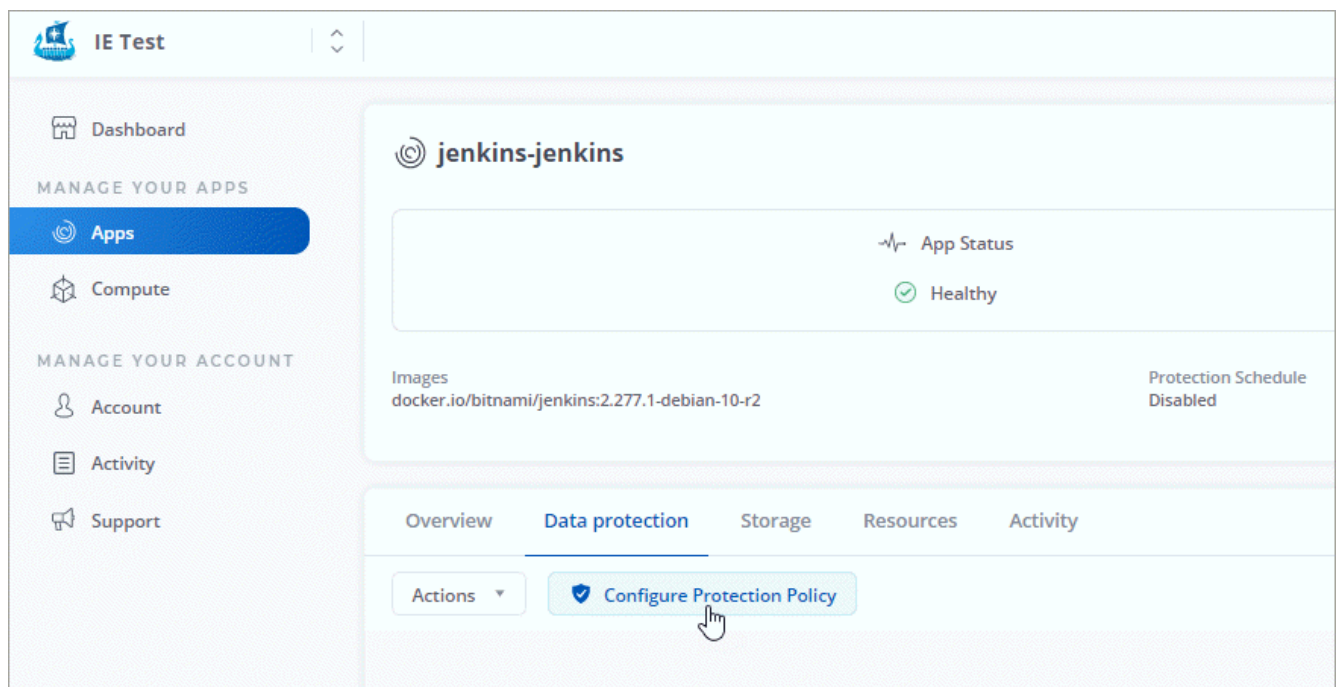

You can't be fully protected until you have a recent backup. This is important because backups are stored in an object store away from the persistent volumes. If a failure or accident wipes out the cluster and its persistent storage, then you need a backup to recover. A snapshot wouldn't enable you to recover.

Configure a protection policy

A protection policy protects an app by creating snapshots, backups, or both at a defined schedule. You can choose to create snapshots and backups hourly, daily, weekly, and monthly, and you can specify the number of copies to retain.

Steps

1. Click **Apps** and then click the name of a managed app.
2. Click **Data Protection**.
3. Click **Configure Protection Policy**.

4. Define a protection schedule by choosing the number of snapshots and backups to keep for the hourly,

daily, weekly, and monthly schedules.

You can define the hourly, daily, weekly, and monthly schedules concurrently. A schedule won't turn active until you set a retention level for snapshots and backups.

When you set a retention level for backups, you can choose the bucket where you'd like to store the backups.

5. Click **Review**.
6. Click **Configure**.

Result

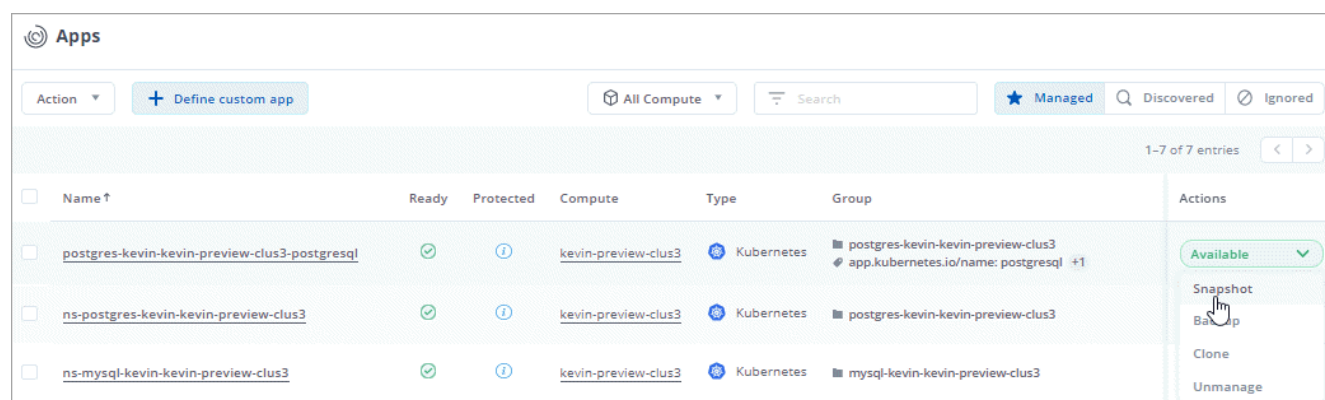

Astra Control implements the data protection policy by creating and retaining snapshots and backups using the schedule and retention policy that you defined.

Create a snapshot

You can create an on-demand snapshot at any time.

Steps

1. Click **Apps**.
2. Click the drop-down list in the **Actions** column for the desired app.
3. Click **Snapshot**.

4. Customize the name of the snapshot and then click **Review Information**.
5. Review the snapshot summary and click **Snapshot App**.

Result

Astra Control creates a snapshot of the apps.

Create a backup

You can also back up an app at any time.

Steps

1. Click **Apps**.
2. Click the drop-down list in the **Actions** column for the desired app.
3. Click **Backup**.

Name	Ready	Protected	Compute	Type	Group	Actions
mariadb-kevin-kevin-preview-clus3-mariadb	✓	✓	kevin-preview-clus3	Kubernetes	mariadb-kevin-kevin-preview-clus3 app.kubernetes.io/name: mariadb +1	Available ✓
mariadb-kevin-kevin-preview-clus3-mariadb-e2f76	✓	⚠	kevin-preview-clus3	Kubernetes	mariadb-kevin-kevin-preview-clus3-mariadb-e2f76 app.kubernetes.io/name: mariadb +1	Snapshot Backup Clone Unmanage
mysql-kevin-kevin-preview-clus3-mysql	✓	✓	kevin-preview-clus3	Kubernetes	mysql-kevin-kevin-preview-clus3 app.kubernetes.io/name: mysql +1	

4. Customize the name of the backup, choose whether to back up the app from an existing snapshot, and then click **Review Information**.
5. Review the backup summary and click **Backup App**.

Result

Astra Control creates a backup of the app.

View snapshots and backups

You can view the snapshots and backups of an app from the Data Protection tab.

Steps

1. Click **Apps** and then click the name of a managed app.
2. Click **Data Protection**.

The snapshots display by default.

Name	Ready	On-Schedule/On-Demand	Created ↑	Actions
ns-maria-snapshot-20200923235241	✓	⌚ On-Demand	2020/09/23 23:52 UTC	Available ✓
ns-maria-snapshot-20200923195151	✓	⌚ On-Demand	2020/09/23 23:51 UTC	Available ✓

3. Click **Backups** to see the list of backups.

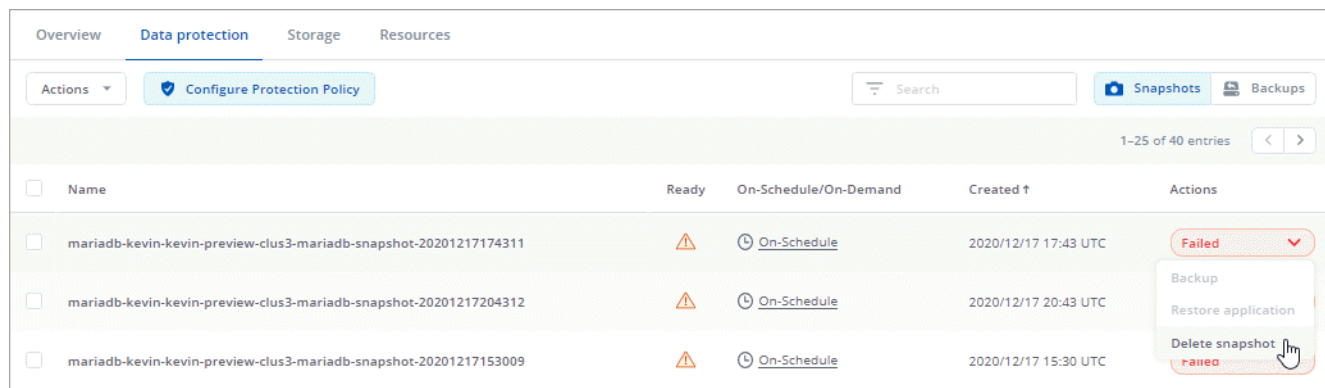

Delete snapshots

Delete the scheduled or on-demand snapshots that you no longer need.

Steps

1. Click **Apps** and then click the name of a managed app.
2. Click **Data Protection**.
3. Click the drop-down list in the **Actions** column for the desired snapshot.

4. Click **Delete snapshot**.

5. Type the name of the snapshot to confirm deletion and then click **Yes, Delete snapshot**.

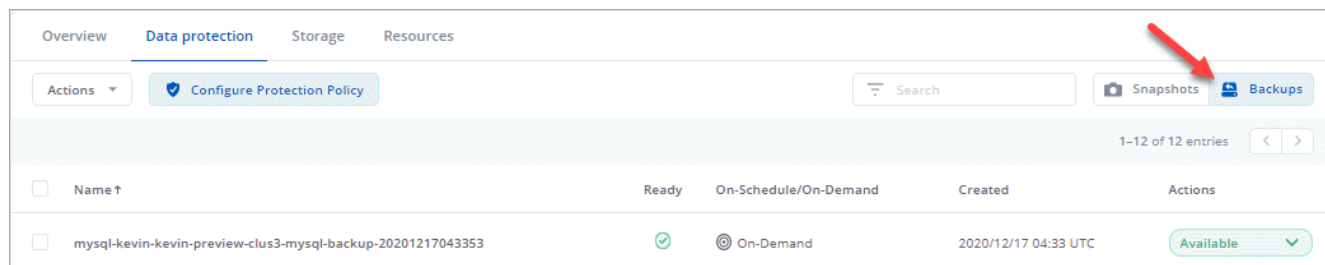

Result

Astra Control deletes the snapshot.

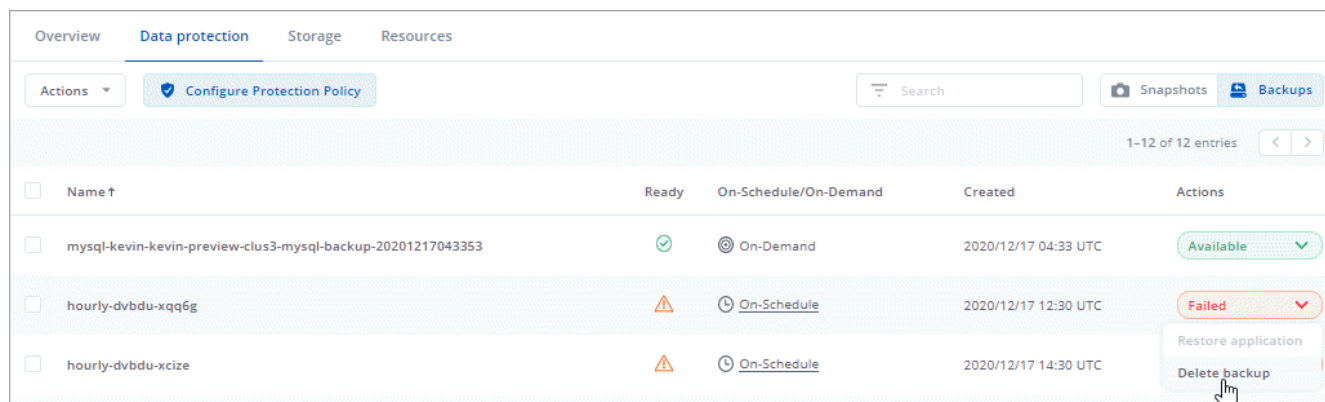

Delete backups

Delete the scheduled or on-demand backups that you no longer need.

1. Click **Apps** and then click the name of a managed app.
2. Click **Data Protection**.
3. Click **Backups**.

4. Click the drop-down list in the **Actions** column for the desired backup.
5. Click **Delete backup**.

6. Type the name of the backup to confirm deletion and then click **Yes, Delete backup**.

Result

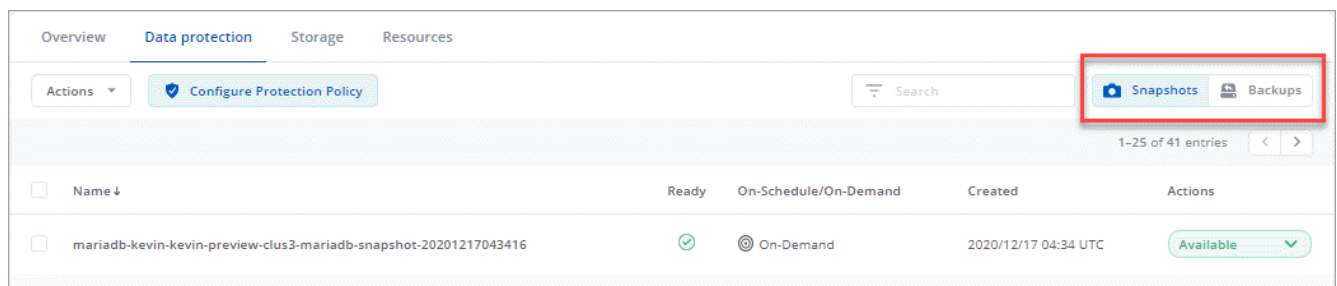

Astra Control deletes the backup.

Restore apps

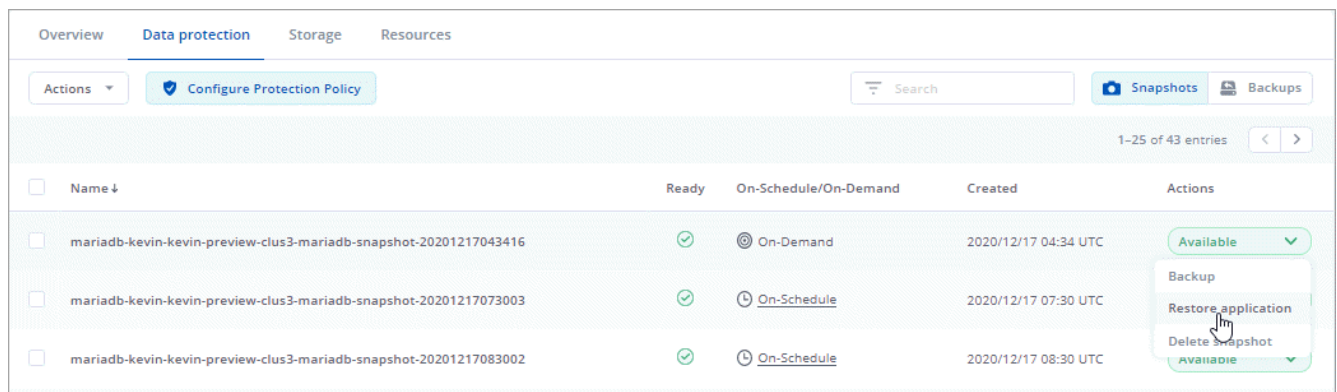

Astra Control can restore your application configuration and persistent storage from a snapshot or backup. Persistent storage backups are transferred from your object store, so restoring from an existing backup will complete the fastest.

Steps

1. Click **Apps** and then click the name of a managed app.
2. Click **Data protection**.
3. If you want to restore from a snapshot, keep **Snapshots** selected. Otherwise, click **Backups** to restore from a backup.

4. Click the drop-down list in the **Actions** column for the snapshot or backup from which you want to restore.
5. Click **Restore application**.

6. **Restore details:** Specify details for the clone:
 - Enter a name and namespace for the app.
 - Choose the destination compute for the app.
 - Click **Review information**.
7. **Restore Summary:** Review details about the restore action and click **Restore App**.

Restore Application

Restore App ✓

Result

Astra Control restores the app based on the information that you provided.

Clone and migrate apps

Clone an existing app to create a duplicate app on the same Kubernetes cluster or on another cluster. Cloning can help if you need to move applications and storage from one Kubernetes cluster to another. For example, you might want to move workloads through a CI/CD pipeline and across Kubernetes namespaces.

When Astra Control clones an app, it creates a clone of your application configuration and persistent storage.

Steps

1. Click **Apps**.
2. Click the drop-down list in the **Action** column for the desired app.
3. Click **Clone**.

4. Clone details: Specify details for the clone:

- Keep the default name and namespace, or edit them.
- Choose a destination compute for the clone.
- Choose whether you want to create the clone from an existing snapshot or backup. If you don't select this option, Astra Control creates the clone from the app's current state.

5. Clone Summary: Review the details about the clone and click **Clone App**.

Result

Astra Control clones that app based on the information that you provided.
