Set up Google Cloud

A few steps are required to prepare your Google Cloud project before you can manage Google Kubernetes Engine clusters with Astra Control Service.

Quick start for setting up Google Cloud

Get started quickly by following these steps or scroll down to the remaining sections for full details.

Review Astra Control Service requirements for Google Kubernetes Engine

Ensure that clusters are healthy and running a Kubernetes version in the range of 1.17 to 1.20, that worker nodes are online and running Container-Optimized OS or Ubuntu, and more. [Learn more about this step.](#)

Purchase Cloud Volumes Service for Google Cloud

Go to the NetApp Cloud Volumes Service page in the Google Cloud Marketplace and click Purchase. [Learn more about this step.](#)

Enable APIs in your Google Cloud project

Enable the following Google Cloud APIs:

- Google Kubernetes Engine
- Cloud Storage
- Cloud Storage JSON API
- Service Usage
- Cloud Resource Manager API
- NetApp Cloud Volumes Service
- Service Consumer Management API
- Service Networking API
- Service Management API

[Follow step-by-step instructions.](#)

Create a service account that has the required permissions

Create a Google Cloud service account that has the following permissions:

- Kubernetes Engine Admin
- NetApp Cloud Volumes Admin
- Storage Admin

- Service Usage Viewer
- Compute Network Viewer

[Read step-by-step instructions.](#)

Create a service account key

Create a key for the service account and save the key file in a secure location. [Follow step-by-step instructions.](#)

Set up network peering for your VPC

Set up network peering from your VPC to Cloud Volumes Service for Google Cloud. [Follow step-by-step instructions.](#)

The following image depicts each of these steps that you'll need to complete.

GKE cluster requirements

A Kubernetes cluster must meet the following requirements so you can discover and manage it from Astra Control Service.

Kubernetes version

A cluster must be running a Kubernetes version in the range of 1.17 to 1.20.

Image type

The image type for each worker node must be Container-Optimized OS or Ubuntu.

Cluster state

Clusters must be running in a healthy state and have at least one online worker node with no worker nodes in a failed state.

Google Cloud region

Clusters must be running in a [Google Cloud region where Cloud Volumes Service for Google Cloud is supported](#). Note that Astra Control Service supports both service types: CVS and CVS-Performance.

Networking

The cluster must reside in a VPC that is peered with Cloud Volumes Service for Google Cloud. [This step is described below.](#)

Private clusters

If the cluster is private, the [authorized networks](#) must allow the Astra Control Service IP addresses:

- 54.164.233.140/32
- 3.218.120.204/32
- 34.193.99.138/32

Mode of operation for a GKE cluster

You should use the Standard mode of operation. The Autopilot mode hasn't been tested at this time. [Learn more about modes of operation.](#)

Purchase Cloud Volumes Service for Google Cloud

Astra Control Service uses Cloud Volumes Service for Google Cloud as the backend storage for your persistent volumes. You need to purchase Cloud Volumes Service for Google Cloud from the Google Cloud Marketplace to enable billing for persistent volumes.

Step

1. Go to the [NetApp Cloud Volumes Service page](#) in the Google Cloud Marketplace, click **Purchase**, and follow the prompts.

[Follow step-by-step instructions in the Google Cloud documentation to purchase and enable the service.](#)

Enable APIs in your project

Your project needs permissions to access specific Google Cloud APIs. APIs are used to interact with Google Cloud resources, such as Google Kubernetes Engine (GKE) clusters and NetApp Cloud Volumes Service storage.

Step

1. [Use the Google Cloud console or gcloud CLI to enable the following APIs:](#)
 - Google Kubernetes Engine
 - Cloud Storage
 - Cloud Storage JSON API
 - Service Usage
 - Cloud Resource Manager API
 - NetApp Cloud Volumes Service
 - Service Consumer Management API
 - Service Networking API
 - Service Management API

The following video shows how to enable the APIs from the Google Cloud console.

▶ <https://docs.netapp.com/us-en/astra/media/get-started/video-enable-gcp-apis.mp4> (video)

Create a service account

Astra Control Service uses a Google Cloud service account to facilitate Kubernetes application data management on your behalf.

Steps

1. Go to Google Cloud and [create a service account by using the console, gcloud command, or another preferred method.](#)

2. Grant the service account the following roles:

- **Kubernetes Engine Admin** - Used to list clusters and create admin access to manage apps.
- **NetApp Cloud Volumes Admin** - Used to manage persistent storage for apps.
- **Storage Admin** - Used to manage buckets and objects for backups of apps.
- **Service Usage Viewer** - Used to check if the required Cloud Volumes Service for Google Cloud APIs are enabled.
- **Compute Network Viewer** - Used to check if the Kubernetes VPC is allowed to reach Cloud Volumes Service for Google Cloud.

If you'd like to use gcloud, you can follow steps from within the Astra Control interface. Click **Account > Credentials > Add Credentials**, and then click **Instructions**.

If you'd like to use the Google Cloud console, the following video shows how to create the service account from the console.

▶ <https://docs.netapp.com/us-en/astra/media/get-started/video-create-gcp-service-account.mp4> (video)

Configure the service account for a shared VPC

To manage GKE clusters that reside in one project, but use a VPC from a different project (a shared VPC), then you need to specify the Astra service account as a member of the host project with the **Compute Network Viewer** role.

Steps

1. From the Google Cloud console, go to **IAM & Admin** and select **Service Accounts**.
2. Find the Astra service account that has [the required permissions](#) and then copy the email address.
3. Go to your host project and then select **IAM & Admin > IAM**.
4. Click **Add** and add an entry for the service account.
 - a. **New members:** Enter the email address for the service account.
 - b. **Role:** Select **Compute Network Viewer**.
 - c. Click **Save**.

Result

Adding a GKE cluster using a shared VPC will fully work with Astra.

Create a service account key

Instead of providing a user name and password to Astra Control Service, you'll provide a service account key when you add your first cluster. Astra Control Service uses the service account key to establish the identity of the service account that you just set up.

The service account key is plaintext stored in the JavaScript Object Notation (JSON) format. It contains information about the GCP resources that you have permission to access.

You can only view or download the JSON file when you create the key. However, you can create a new key at any time.

Steps

1. Go to Google Cloud and [create a service account key by using the console, gcloud command, or another preferred method](#).
2. When prompted, save the service account key file in a secure location.

The following video shows how to create the service account key from the Google Cloud console.

▶ <https://docs.netapp.com/us-en/astra/media/get-started/video-create-gcp-service-account-key.mp4> (video)

Set up network peering for your VPC

The final step is to set up networking peering from your VPC to Cloud Volumes Service for Google Cloud.

The easiest way to set up network peering is by obtaining the gcloud commands directly from Cloud Volumes Service. The commands are available from Cloud Volumes Service when creating a new file system.

Steps

1. [Go to NetApp Cloud Central's Global Regions Maps](#) and identify the service type that you'll be using in the Google Cloud region where your cluster resides.

Cloud Volumes Service provides two service types: CVS and CVS-Performance. [Learn more about these service types](#).

2. [Go to Cloud Volumes in Google Cloud Platform](#).
3. On the **Volumes** page, click **Create**.
4. Under **Service Type**, select either **CVS** or **CVS-Performance**.

You need to choose the correct service type for your Google Cloud region. This is the service type that you identified in step 1. After you select a service type, the list of regions on the page updates with the regions where that service type is supported.

After this step, you'll only need to enter your networking information to obtain the commands.

5. Under **Region**, select your region and zone.
6. Under **Network Details**, select your VPC.

If you haven't set up network peering, you'll see the following notification:

Network Details

☐ Shared VPC configuration
Provide the host project name when deploying in a shared VPC service project.

VPC Network Name *
stg-cv-vpc

Select the VPC Network from which the volume will be accessible. This cannot be changed later.

The service networking peering for this VPC is not set up.

VIEW COMMANDS HOW TO SET UP NETWORK PEERING

7. Click the button to view the network peering set up commands.
8. Copy the commands and run them in Cloud Shell.

For more details about using these commands, refer to the [Quickstart for Cloud Volumes Service for GCP](#).

[Learn more about configuring private services access and setting up network peering.](#)

9. After you're done, you can click cancel on the **Create File System** page.

We started creating this volume only to get the commands for network peering.
